

Microsoft Teams Meeting

Internship Backend Sprint Planning – Authentication & Platform Owner

Host: Ddumba Abdallah Kato

Date: Thursday, July 9, 2026

Time: 10:00 PM – 11:30 PM (EAT)

Meeting Link:

<https://teams.live.com/join/9374607526674?p=WGXaW28ke2ci3UUXoL>

Today's Objective

Understand the Frontend and Convert It Into Backend Requirements

Today we are NOT writing backend code.

Today we are preparing the foundation for the next 22 days.

The focus is:

1. Understand the existing React frontend.
2. Understand Authentication requirements.
3. Understand Platform Owner requirements.
4. Identify required database tables.
5. Identify required APIs.
6. Assign responsibilities.

Meeting Agenda

1. Introduction (10 Minutes)

Explain:

We already have the frontend interface.

Our job now is to build the engine behind it.

Every screen in the frontend requires:

- Database tables
- Backend logic
- API endpoints
- Security rules

Our process:

Frontend Page

↓

Business Requirement

↓

Database Design

↓

API Design

↓

Backend Development

↓

Testing

Frontend Integration

2. Project Scope Explanation (10 Minutes)

Tell them:

For the next 22 days we only build:

Module 1

Authentication

Includes:

- Login
- Register
- Logout
- Forgot Password
- Reset Password
- JWT
- Roles
- Permissions
- Protected Routes

Module 2

Platform Owner / Super Admin

Includes:

- Super Admin Dashboard
- Manage Schools
- Approve Schools
- Manage Platform Users
- Configuration
- Subscriptions
- Analytics
- Monitoring
- Support
- Developer Tools

3. Frontend Review Exercise (20 Minutes)

Open the project:

black-main

Show them:

src/pages

Explain:

The frontend is already telling us what the backend must provide.

Open:

src/pages/auth

Show:

MainLogin.jsx

TenantLogin.jsx

ForgotPassword.jsx

SchoolRegistration.jsx

Ask:

What information does this page need from backend?

Expected answers:

Login:

- Email
- Password
- User role
- Token

Register:

- Name
- Email
- Password
- Role

Then show:

src/pages/superadmin

Explain:

These pages belong to Platform Owner.

4. Assignment Allocation (30 Minutes)

Brian

Assignment:

Authentication Analysis

Study:

src/pages/auth

Files:

MainLogin.jsx

TenantLogin.jsx

ForgotPassword.jsx

SchoolRegistration.jsx

Deliver:

Authentication Design Document

Must include:

1. User Flow

Example:

User enters email/password

↓

Backend validates

↓

Database check

↓

Generate JWT

↓

Return token

2. Required Database Tables

Example:

users

roles

permissions

sessions

password_resets

3. Required APIs

Example:

POST /auth/login

POST /auth/register

POST /auth/logout

POST /auth/forgot-password

4. Security Requirements

Example:

- Password hashing
- JWT
- Token expiry
- Role checking

Nicolas

Assignment:

PostgreSQL Database Architecture

Study:

Authentication requirements.

Research:

- PostgreSQL
- Prisma ORM
- Database relationships
- Multi-tenancy structure

Deliver:

Database Design Document

Must include:

Tables

Example:

users

roles

permissions

refresh_tokens

For every table:

Explain:

Column

Type

Purpose

Relationship

Example:

users

id

email

password_hash

role_id

created_at

Also prepare:

Database relationship diagram.

Juma

Assignment:

Platform Owner Analysis

Study:

src/pages/superadmin

Files:

SAHome.jsx

SASchools.jsx

SAUsers.jsx

SASubscriptions.jsx

SAConfiguration.jsx

SAAalytics.jsx

SAMonitoring.jsx

SADeveloperTools.jsx

SAEmergency.jsx

SASupport.jsx

Deliver:

Platform Owner Specification Document

For every page document:

Example:

SASchools.jsx

Purpose:

Manage registered schools.

Required database:

schools

school_documents

school_users

Required APIs:

GET /schools

POST /schools

PATCH /schools/:id

DELETE /schools/:id

Permissions:

Only Super Admin.

5. Git Instructions (10 Minutes)

Everyone creates their own branch.

Nobody touches main.

Example:

Brian:

```
git checkout -b brian-auth-analysis
```

Nicolas:

```
git checkout -b nicolas-database-analysis
```

Juma:

```
git checkout -b juma-platform-analysis
```

When complete:

```
git add .
```

```
git commit -m "Completed analysis document"
```

```
git push origin branch-name
```

Create Pull Request.

Do not merge.

6. AI Research Instructions (10 Minutes)

Tell them:

You can use:

- ChatGPT
- Claude
- Gemini
- DeepSeek

But use AI correctly.

Wrong:

Build my whole backend.

Correct:

Explain authentication architecture for Node.js PostgreSQL multi-tenant SaaS.

Every AI answer must be checked against:

- Existing frontend
- Project requirements
- Database design

End of Today's Meeting Deliverables

Before the next meeting:

Brian submits:

Authentication Design Document

Nicolas submits:

Database Architecture Document

Juma submits:

Platform Owner Specification Document

Your Closing Statement

Today we are not measuring coding speed.

We are building the foundation.

A good developer first understands the problem before writing code.

Once these documents are approved, implementation begins. Our next step will be creating the backend project, PostgreSQL database, Prisma setup, and starting authentication development.
